PROVINCES

NATURAL RESOURCES *of the* PRAIRIE PROVINCES

A BRIEF COMPILATION RESPECTING
THE DEVELOPMENT OF MANITOBA
SASKATCHEWAN AND ALBERTA

1923

DEPARTMENT OF THE INTERIOR
CANADA

HON. CHARLES STEWART
Minister

W. W. CORY, C.M.G.
Deputy Minister

PREPARED IN THE
NATURAL RESOURCES INTELLIGENCE SERVICE
UNDER THE DIRECTION OF F. C. C. LYNCH, SUPERINTENDENT

In the preparation of this pamphlet the assistance rendered by the Department of Mines, the Department of Marine and Fisheries, the Dominion Bureau of Statistics, and several Branches of the Department of the Interior is hereby gratefully acknowledged.

OTTAWA
F. A. ACLAND
PRINTER TO THE KING'S MOST EXCELLENT MAJESTY
1923

CLIMATE

The climate of the Prairie Provinces is remarkably healthy, and though it is subject to extremes the dryness of the air mitigates the severity of the low temperatures of winter and alleviates the unpleasantness usually associated with high summer temperatures in humid atmospheres. In Alberta the winter cold is also tempered by the warm chinook winds, which at several intervals during the winter blow over the country from the west and southwest. In certain sections of the country such as southern Alberta and Saskatchewan, particularly the former, the light precipitation calls for dry farming methods. Some hail falls annually in various districts, but its action, though severe at times, is usually local, and loss is frequently covered by provincial hail insurance.

Manitoba has a mean annual temperature of 36° Fahr., with a growing season temperature of 56° Fahr. on the average, a precipitation of about 20 inches annually, chiefly rain, and a daily average sunshine record of eight to nine hours during the growing season.

Saskatchewan has a mean temperature of 36° Fahr. for the year with a growing season temperature of about 55° Fahr. and a mean annual precipitation of only about 16.75 inches. The sunshine average is nearly nine hours a day in the growing months. The precipitation, though light, is practically all rain and comes as a rule when most needed, in May, June and July.

Alberta has a mean annual temperature of 38.8° Fahr. which is higher than that of either Saskatchewan or Manitoba, but a lower annual rainfall, namely 16.1 inches. The sunshine record is high for the growing season, about ten hours a day, on the average, during April to September inclusive. The precipitation is practically all rain. The growing season mean temperature is about 60° Fahr.

The following temperature, precipitation and sunshine tables are intended to give a general survey of climatic conditions over a period of years. The various stations have been chosen, firstly, to give adequate information regarding each section of the country in which people would be interested, and secondly, to secure a station in each of the different sections where observations had been recorded for the longest time.

The temperature figures are obtained as follows: At the stations of the Dominion Meteorological Service self-registering thermometers record temperatures during each twenty-four hours. The highest and lowest temperatures thus recorded are tabulated and monthly high and low averages obtained. The two columns under temperature are then arrived at by averaging these monthly figures over the period of years in which observations have been taken at that station. Temperatures below zero have the minus sign (—) prefixed.

Under the collective term precipitation is included all moisture, rain, snow, hail, sleet, etc., which has been precipitated from the atmosphere upon the earth. This moisture is measured on an impervious surface and is expressed in inches of depth. Snow figures are given separately and are dealt with as indicated in the table. Due to the fact that only seven months' precipitation is given, an additional figure has been added showing average yearly total precipitation over the period of years shown in the table.

The sunshine table gives, in the first column, an average of the actual number of hours sunshine recorded during each month over the period of years named, and the second column gives the number of hours of possible sunshine if there had been no cloudy days, rain, etc. In those cases where sunshine records were not available for the station given, figures from the nearest station have been substituted.

MANITOBA

TABLE SHOWING TEMPERATURE, PRECIPITATION AND SUNSHINE.

Average figures given.

WINNIPEG

Height above sea, 760 feet

Months	Temperature Deg. Fahr.		Precipitation in inches			Sunshine

†Days in which temperature reached 32° Fahr. (freezing point of water) or lower.

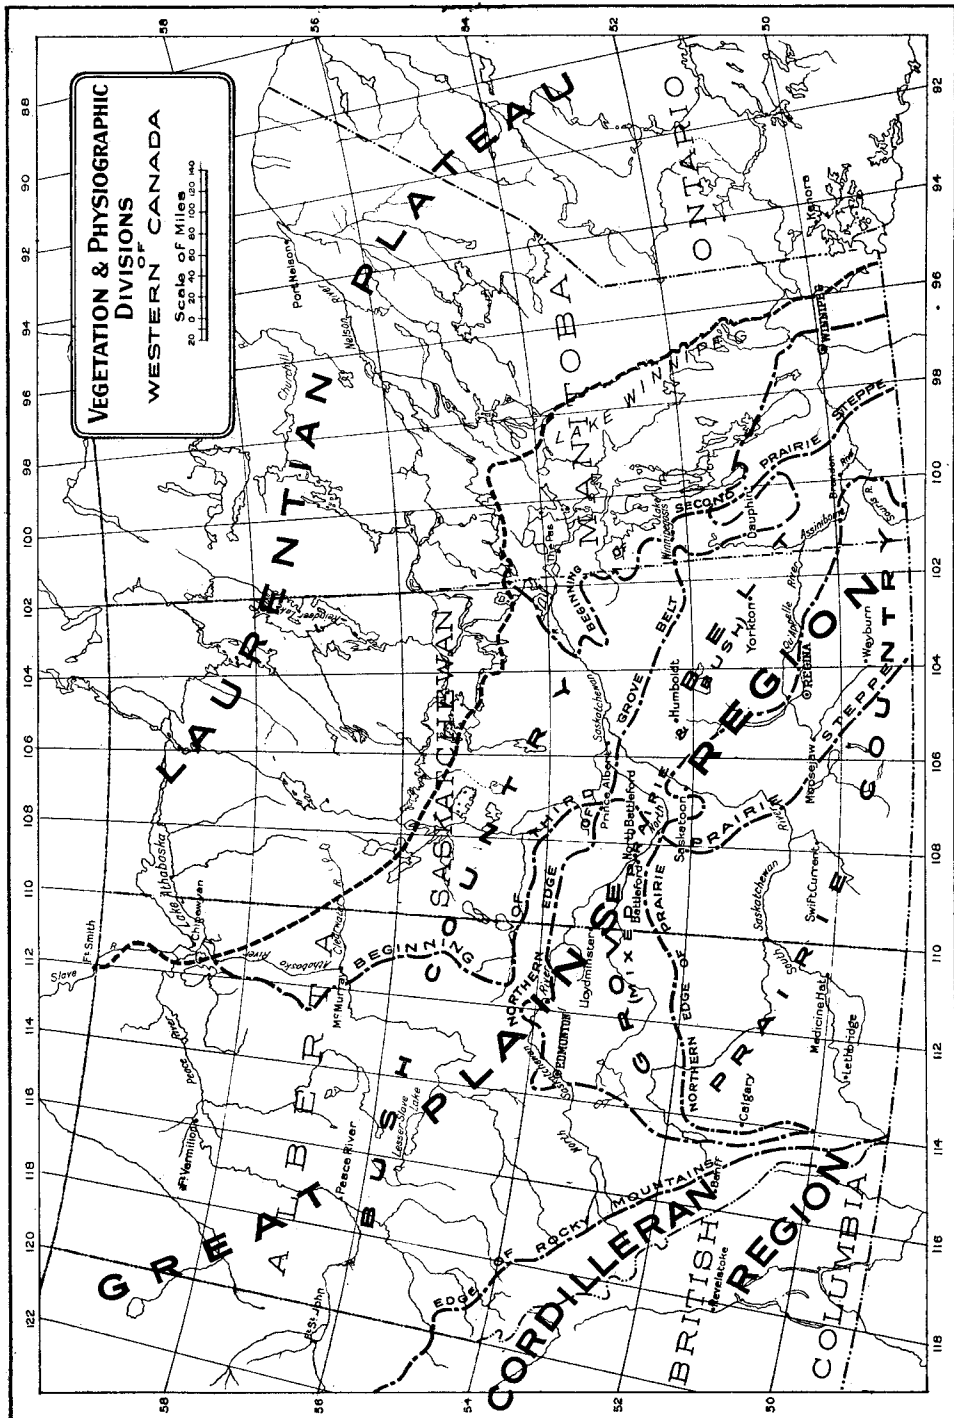

LANDS AND AGRICULTURE

Extending from the western boundary of Ontario to the Rocky mountains is a vast fertile area, the Great Western Plains of Canada. From a breadth of 800 miles at the international boundary this area gradually narrows towards the north as a result of the western extension of the Laurentian plateau. There are three steppes of different elevations in this great plain, rising from east to west, the lowest and most eastern including the Red river valley at an elevation of 700 to 800 feet above the sea. The range of hills in Manitoba running from the Pembina mountains on the south to the Porcupine and Pasquia hills on the north, marks the beginning of the second steppe which has an average elevation of 1,600 feet. The third and largest steppe includes most of Alberta, rising from 2,000 feet on the east to 4,000 feet as the foothills of the Rocky mountains are approached.

There are three well defined belts of vegetation in Western Canada. The southern part of the plains region is an area of treeless grassy prairies. It includes the semi-arid areas of southern Alberta and southwestern Saskatchewan, where climatic conditions have led to the development of irrigation on a large scale. The northern portions of the western provinces are covered with a forest of spruce, poplar, birch, tamarack and willow, the southern edge of the forest area running northwest from south of lake Winnipeg to the vicinity of Edmonton. Between the prairie and the bush country is a transition belt of mixed prairie and woodland, 50 to 125 miles in width, commonly called the grove or park belt. The striking difference between this belt in its natural state and the prairie belt to the south is its heavier vegetation. The grass is longer and coarser, scrub is common and there are alternating open and wooded areas. Parts of the Peace River district in northern Alberta have similar characteristics.

In Manitoba, Saskatchewan and Alberta, the public lands are under the control of the Dominion Government. The total area of the three provinces is 485,642,880 acres, of which it is estimated that nearly 170,000,000 acres can be utilized for agricultural purposes. At one time regarded as too cold and barren for agriculture, this territory has been settled only at a comparatively recent date, the first railway to open up the country being completed in 1885. With the delusion respecting climate and fertility swept away, with easy tillage due to the absence of forest to be laboriously cleared, with easy grades for railways, and with a free homestead policy to attract the pioneer, the settlement of western Canada advanced with wonderful rapidity. In 1891 the population of what is now Manitoba, Saskatchewan and Alberta was 219,305, in 1921 it was 1,956,082, almost an eight-fold increase in 30 years. The result has been the transformation of the prairies and the effects of their development have been felt in almost every phase of industrial and commercial activity throughout the Dominion. In 1922 the area under field crops in Manitoba was 6,758,200 acres, in Saskatchewan 19,833,200 acres, and in Alberta 10,005,600 acres, a total of 36,597,000 acres throughout the three provinces.

In all new agricultural countries the tendency is to develop those farming activities best suited to the area. The physical features, soil and climate of the prairie provinces make them particularly suited for grain growing, and the growing of cereal crops is, therefore, the dominant branch of the farming industry, the area under wheat, oats, barley, rye and flax in 1922 forming respectively 58.0, 23.4, 5.4, 5.3 and 1.5 per cent of the total area under field crops. Wheat is the most important crop, climatic conditions in the Canadian west being conducive to the growing of the finest grade of milling wheat in the world. The dry

Prepared in the N.R.I. Service
Dep't of the Interior

climate and the short but intensive growing season—long hot days and short cool nights—favour the growth of a crop known the world over as “number 1 hard spring” or “Manitoba hard.” Mixed with the softer grades of wheat in milling, it raises the standard of the finished product and consequently is in demand by other wheat producing and milling countries. The value of the wheat crop of the prairie provinces in 1922 constituted over one-fifth of the total agricultural production of Canada.

In parts of Saskatchewan and Alberta stock-raising is still carried on as a primary industry. The southern portion of these provinces seems particularly well suited for this purpose, and at one time was famous for its ranches, providing ample pasturage for all the horses, cattle and sheep that were raised on these prairie lands. The increasing value of the lands, the demand for their use for grain growing and the extension of cultivation in the west, have materially reduced the area available for ranching purposes. The increased number of farms carrying small herds more than maintains, however, the average live stock production. The Peace River district in Alberta and northern portions of Saskatchewan and Manitoba have large areas well adapted for grazing purposes.

It is only in recent years that the prairie provinces have taken seriously to dairying, but the industry has made wonderful progress, and the wide adoption of the manufacture of dairy products in Western Canada has been one of the most pronounced features of Canadian agriculture. The vast areas of Western Canada still unoccupied or still devoted entirely to grain growing are well adapted to the production of milk, and in all probability the greatest expansion of the Canadian dairy industry in future will take place in these provinces. A feature of the butter made on the prairies is its excellent keeping quality, a very important consideration now that there is a surplus for export. The fine quality of the dairy products of Manitoba, Saskatchewan and Alberta is also shown by their popularity in open competition. The entries of these provinces have been to the front in interprovincial and international exhibitions, repeatedly winning the leading prizes wherever shown.

The farmers of the prairie provinces still devote most of their attention to the growth of wheat, but it is altogether likely that as the problem of conserving the soil fertility becomes of more importance, the vast grain-growing areas of western Canada will turn more to mixed farming. The trend is already very apparent and agriculture in these provinces is now more and more finding its outlet in diversified farming and animal husbandry. Horticulture is also gaining ground, and apples, plums and small fruits are successfully grown in many parts of the country. Extensive and increasing assistance in the promotion of agriculture is rendered by the dominion and provincial departments of agriculture, conveying to the man on the farm by various means the facts essential to the successful prosecution of his calling.

The free homestead policy, whereby a qualified person may acquire a quarter-section of land by the performance of certain residence and improvement duties, still applies to the public lands in the prairie provinces except the southern portions of Saskatchewan and Alberta, but with the exception of the northern districts of the three provinces, suitable lands available for homestead entry within easy reach of railroads are practically exhausted. There are, however, tens of millions of acres of fertile lands lying idle within 10 and 15 miles of existing railways. These lands are privately owned and many of them can be purchased at reasonable prices. The Natural Resources Intelligence Service of the Department of the Interior, Ottawa, issues lists of such lands, giving brief particulars, including location, prices, terms and owners' names and addresses. These lists are available to prospective home-seekers and purchasers.

Though the great agricultural production of Western Canada suggests a vast expanse of farm lands, it must not be concluded that urban and social

facilities are lacking. Scattered over the face of the prairies are seventeen cities, the largest being Winnipeg with a population of 179,000. In addition there are 163 towns and 489 incorporated villages. Thorough and comprehensive school systems care for the important matter of education. Ready intercourse is provided by the Government-owned telephone systems. Ample provision is made for road allowances and the mileage of improved highways is being rapidly extended. With freedom of worship religious denominations are widely represented. Rural hospitals, municipally owned, and rural health nursing established along the most advanced lines, are proving of great benefit to agricultural settlers. The pleasures of rural life are furthered through the activities of the Agricultural Extension Services of the respective provinces. Through the organization of community clubs, competitions for boys and girls at agricultural fairs, the encouragement of school gardens, travelling libraries, lectures on various subjects, farm literature, and in many other ways the Agricultural Extension Services foster greater interest in agriculture and the social aspect of farm life.

SYSTEM OF SURVEY OF DOMINION LANDS

Dominion Lands are laid off in square townships containing thirty-six sections of as nearly one mile square as the convergence of meridians permits. Such sections are bounded and numbered as shown in the township diagram below.

PLAN OF A TOWNSHIP

Monuments shown thus.....•

A section contains six hundred and forty acres. Each section is divided into four quarter-sections containing one hundred and sixty acres each.

Road allowances are provided as indicated by double lines on the above diagram, namely: running north and south between each section; running east and west, along the township lines and the lines two miles distant therefrom.

Townships are numbered consecutively from south to north. Each row of townships thus formed is given a range number. The ranges start from a Principal meridian and are numbered consecutively. The 1st meridian is a few miles west of Winnipeg. Ranges number from this meridian as a starting point, both eastward and westward. In regard to all other meridians, ranges number westward only.

It will be seen that when numbers for the township, range, and meridian are given, the exact location of the township is known.

PLAN OF A SECTION

Each section is deemed to be divided into forty-acre areas, known as legal subdivisions and numbered and bounded as in the diagram above.

SYNOPSIS OF CANADIAN NORTHWEST LAND REGULATIONS

All surveyed agricultural Dominion lands in Manitoba, Saskatchewan, Alberta, and 3,500,000 acres in northern British Columbia, known as the Peace River Block, which are not disposed of and not reserved or occupied, are open to homestead entry except as follows: all lands south of the south boundary of township 16 in the provinces of Saskatchewan and Alberta are withdrawn from homesteading, and a temporary reservation is also being placed upon all the remaining lands in the Calgary, Lethbridge and Swift Current land districts, together with those portions of the Moose Jaw and Saskatoon districts lying west of the 3rd meridian, pending a general inspection of such lands. Islands are reserved from entry.

The sole head of a family, or any male over eighteen years old may homestead one quarter-section of available Dominion land in Manitoba, Saskatchewan, Alberta or the Peace River Block in British Columbia. Applicants need not be British subjects at the date of application for entry but are required to declare their intention of becoming British subjects. Evidence of naturalization must be furnished before patent is issued except in cases for which provision is made by law. Application for homestead entry may be made by a person eligible under the provisions of The Dominion Lands Act, either at the Land Agency for the district in which the land is situated, or at the office of a sub-agent authorized to transact business in the district. Entry by proxy may be made at any Dominion Lands Agency (but not sub-agency), on certain conditions. An entry does not include the mineral or water rights. An agent may reserve one available quarter-section as a homestead for a minor over seventeen years of age until he is eighteen.

The homesteading conditions to be fulfilled comprise: Six months' residence upon and cultivation of the land in each of three years. A homesteader may reside within nine miles of his homestead on a farm of at least eighty acres, on certain conditions. A habitable house is required, except where residence is performed in the vicinity. The area of cultivation is subject to reduction in case of rough, scrubby or stony land. Live stock may be substituted for cultivation under certain conditions. A homesteader is allowed six months from the date of his entry within which to perfect the same by taking possession of the land and beginning his residence duties. Any entry not so perfected within that period is liable to cancellation.

For further information regarding homesteading write to the Dominion Lands Branch, Department of the Interior, Ottawa.

SYNOPSIS OF REGULATIONS GOVERNING THE GRANTING OF GRAZING AND HAY
LEASES ON DOMINION LANDS AND OF HAY PERMITS ON DOMINION
AND SCHOOL LANDS

Grazing leases of vacant Dominion lands unfit for agricultural purposes may be issued to British subjects for a period of ten years. The lands covered shall not be open to settlement during continuance of the lease. In the granting of leases, preference shall be given applicants who own adjoining lands. All applications for leases should be made to the Agent of Dominion Lands for the district on a form supplied by him for the purpose, and should be accompanied by the rental for the first six months on the tract applied for.

No person or company shall be permitted to obtain under lease by original grant more than 12,000 acres.

The lessee shall, within each of the three years from the date of the lease, place upon the tract of land leased not less than one-third of the whole number of stock which is required to be placed upon the leasehold, namely, one head

of cattle or five head of sheep for every thirty acres of land covered by the lease, and shall during the rest of its term, maintain stock thereon in that proportion, and at least 25 per cent of the stock shall be breeding stock.

The lessee shall pay an annual rental at the rate of two cents per acre for every acre covered by the lease, payable half-yearly in advance.

The lessee shall be entitled to the hay on his leasehold and he may cultivate any portion of his leasehold for the purpose of growing winter feed for his stock, but shall not have the right to dispose of any such feed or hay by barter or sale.

Permits to cut hay, on vacant Dominion or school lands, may be obtained annually. A permit fee of one dollar shall be charged.

Permits issued shall be subject to dues of twenty-five cents per ton for domestic use, by actual settlers, and one dollar per ton for hay cut by other than settlers.

Hay permits are issued to cover one quarter-section but more than one permit may be obtained by an applicant provided he has the necessary number of stock. Hay permits are issued on the basis of three tons of hay to each head of stock.

A lease to cut hay on unoccupied Dominion lands may be issued to a settler who owns at least ten head of stock for a term of five years, at an annual rental of fifty cents per acre. No person may lease more than forty acres.

Leases may be granted to the Provincial Governments of Manitoba, Saskatchewan and Alberta for community grazing purposes for a term of ten years at an annual rental of not more than two cents per acre.

More detailed information regarding the granting of grazing leases, also hay leases and permits on Dominion lands may be obtained from the Controller of the Timber and Grazing Lands Branch, Department of the Interior, Ottawa.

GRAZING PERMITS ON SCHOOL LANDS

School Lands comprise sections 11 and 29 in every surveyed township in Manitoba, Saskatchewan and Alberta, and have been set apart by Act of Parliament as an endowment for the purposes of education and comprise approximately one-eighteenth of the surveyed lands in these provinces.

Grazing permits may be issued on School Lands, available for the purpose, in the provinces of Manitoba, Saskatchewan and Alberta, for one year, or portion thereof, upon payment in advance at the rate of six cents per acre per annum and an office fee of one dollar. The permits shall, except in cases where issued for a portion of a year only, be operative from the first day of April of the year in which issued and shall expire on the thirty-first day of March following.

Applications to acquire grazing permits on School Lands must be filed with the Agent of Dominion Lands for the district in which the lands are situated, or with a sub-agent for such district, for transmission to the agent, on the form prescribed for the purpose and must be accompanied by rental and office fee as set forth above.

Priority of application shall, at the option of the minister, be based upon the date of receipt of such application, accompanied by the required rental, in the office of the Agent of Dominion Lands for the district in which the land is situated.

Grazing permittees shall, at the discretion of the minister, have prior right to renewal permits year after year until such time as the Minister shall see fit to dispose of the land by sale or otherwise, provided applications for such renewals are filed on the prescribed form with the Agent of Dominion Lands for the dis-

trict on or before the first day of February next preceding the termination of the permit, accompanied by the ensuing year's rental and office fee, otherwise the permittees' right to renewal shall lapse.

Holders of grazing permits shall, upon application to the Agent of Dominion Lands for the district and upon payment of an office fee of one dollar, be entitled to free permits to cut on the lands whatever hay they require for their own use, but not for barter or sale. The permittees may also acquire permits to cut hay from the land for the purpose of barter or sale upon payment to the Agent of Dominion Lands for the district of an office fee of one dollar and dues at the rate of one dollar per ton for the quantity of hay to be cut for the purpose.

Full particulars in regard to grazing permits on School Lands will be furnished upon application to the Secretary, Department of the Interior, at Ottawa, or to any Agent of Dominion Lands.

AGRICULTURAL LOANS

SUMMARY OF LEGISLATION PROVIDING FOR FARM LOANS AND RURAL CREDITS MANITOBA

The Manitoba Farm Loans Act

This Act provides that persons residing or intending to reside on lands within the province may obtain through the Manitoba Farm Loans Association, on first mortgage security, loans up to fifty per cent of the appraised value of the property offered, but not exceeding \$10,000. Loans extend over a period of thirty years at a rate of interest of 7 per cent per annum, repayment being made on an amortization basis by equal annual payments composed of principal and interest. Loans may be made for the purpose of acquiring or improving land, the erection of farm buildings, the purchase of live stock, the discharge of liabilities, or for any other purpose calculated to increase land productiveness. Application for loan should be made to the Secretary of the Manitoba Farm Loans Association, Winnipeg, Manitoba.

The Manitoba Rural Credits Act

The Manitoba Rural Credits Act provides for the organization of rural credit societies to enable individual shareholders to obtain short term loans for the purchase of seed, feed, implements, stock, the erection of silos, and for the carrying on of farming operations. To establish a rural credit society a minimum of thirty-five farmers must subscribe at least \$100 each, of which 10 per cent must be paid up; the rural municipality and the province each subscribe one-half of this amount, also paying 10 per cent. Each society is managed by a board of nine directors, three of whom are elected by the shareholders, three appointed by the municipality, and three by the province. Interest is at the rate of 7 per cent per annum and all loans are repayable during the calendar year in which they are made, but are renewable at the directors' discretion.

The organization of a rural credit society is initiated by not less than fifteen farmers applying by petition to the provincial secretary for permission to be incorporated.

SASKATCHEWAN

The Saskatchewan Farm Loans Act

This Act authorizes the Saskatchewan Farm Loan Board to make loans to farmers for the acquisition, development or improvement of land, and for the discharge of liabilities previously incurred for such purposes. Loans are made on mortgage security and must not exceed 50 per cent of the Board's valuation of the property; interest at the rate of 6½ per cent per annum, and principal and interest are repayable in thirty years on the amortization plan. Application for loan should be made to the Saskatchewan Farm Loan Board, Regina.

The Live Stock Purchase Act

This Act provides for the purchase of live stock by the provincial government to be sold to agriculturists for cash, or partly cash and partly credit, in which latter case a lien is taken on the animals till they are paid for. Credit will be given for a term not exceeding three years and to the extent of not more than 75 per cent of the value of the animals. Interest at the rate of 6 per cent before maturity and 8 per cent thereafter will be charged on all accounts. Application for purchase should be made to the Live Stock Commissioner, Department of Agriculture, Regina.

ALBERTA

The Alberta Co-operative Credit Act

This Act authorizes the formation of co-operative credit societies for the purpose of lending money to farmers on joint municipal and government guarantee. To establish a society a minimum of 30 farmers must subscribe stock to the value of \$3,000 of which 20 per cent must be paid up. Each society is managed by a board of eight directors, four of whom are elected by the subscribers, three appointed by the province, and one appointed by the municipality. Short term loans are made to members for the purchase of seed, feed, implements, stock, and for the carrying on of farming operations. The rate of interest is not fixed but must not exceed $7\frac{1}{2}$ per cent per annum. The incorporation of a co-operative society is obtained by a petition signed by fifteen farmers who have subscribed stock to the value of \$1,500 with 20 per cent paid in cash.

SYNOPSIS OF SOLDIER SETTLEMENT ACT

The Soldier Settlement Act applies to ex-members of the Canadian Expeditionary Force who served overseas or who, on account of some disability due to service in Canada, have received or are receiving a pension or gratuity in lieu thereof; to widows of men who died on active service and who would have been eligible for the benefits of the act; to members of the Imperial or Allied Forces who lived in Canada prior to the war; and to Imperial or Dominion Forces who served outside of the country of their enlistment. In the case of the last named, however, they are required to gain experience on farms in Canada before they will be granted qualification certificates.

The Soldier Settlement Board may grant to eligible and qualified returned men assistance by way of loans to enable them to take up farming. There are three classes of loans:—

1. If land is purchased for the settler: a maximum of \$4,500 for land purchase, \$1,000 for permanent improvements, and \$2,000 for stock and equipment.

The settler is required to pay in cash ten per cent of the cost price of his land and to have sufficient means to enable him to carry on until returns from his farm are forthcoming. In the case of Imperials or Allied Forces who were not resident in Canada at the outbreak of the war they will be required to pay down twenty per cent of the cost of land, stock and equipment.

2. If the settler takes up Dominion lands: \$1,000 for improvements and \$2,000 for stock and machinery.

The Act provides for the granting of a quarter-section (160 acres) as a soldier grant, and in addition the settler may exercise his civilian right to homestead another quarter-section.

3. If the settler already owns land: \$3,500 to remove encumbrances, not exceeding 50 per cent of the value of the land, \$1,000 for permanent improvements, and \$2,000 for stock and equipment, the whole, however, not to exceed \$5,000.

In the session of 1922 amendments were adopted by Parliament by which loans for all purposes will run for twenty-five years. Under the old act the stock and equipment loans were repayable in four or six annual instalments.

Parliament also granted certain interest exemptions to men who went on the land prior to October 1, 1921, as follows: 1919, four years' exemption; 1920, three years'; 1921, two years'. Those who hereafter take up land under the Board will not receive the benefit of interest exemption. The interest rate is 5 per cent.

For more detailed information regarding soldier settlement write to the Soldier Settlement Board, Ottawa.

IRRIGATION DEVELOPMENT

The cycle of dry years in southern Alberta and Saskatchewan, commencing in 1917 and apparently ending in 1921, is the longest continuous period of drouth that has been recorded in Canada. During this cycle the average annual precipitation was approximately 8 inches while for the preceding period of wet years from 1911 to 1916 the annual rainfall averaged over 15 inches. Irrigation is usually a necessity in most years if the annual rainfall averages less than 20 inches.

The present enthusiasm that prevails for irrigation schemes is in marked contrast to the indifference that was shown prior to 1917. Whole districts have organized and are organizing for co-operative effort wherever it is physically and economically feasible to get water on the land. As soon as the project has been favourably reported upon by the Dominion Reclamation Service, irrigation districts are organized under provincial laws and construction is usually undertaken as soon as assurance is given that the provincial government is willing to guarantee the bonds that are issued and secured by the lands within the organized district.

ALBERTA

The dry zone of southern Alberta lies approximately between the 4th and 5th meridians and extends north to townships 34. In this area there are about 23,000,000 acres, much of which, however, is unsuited for irrigation on account of the varying altitudes or general topography. Certain areas along the western boundary of this zone, especially in the foothills district, receive sufficient rainfall to make them suitable for grazing purposes. No calculation has ever been made to ascertain how much of this region could be irrigated for the reason that the water supply is the limiting factor. It is believed, however, that even with the fullest economical development of storage, there is not enough controllable water to irrigate more than 2,500,000 acres of the district—approximately 10 per cent of its total.

SASKATCHEWAN

Chiefly on account of inadequate water supply but partly also because of climatic and topographical conditions there is little prospect of extensive large-scale irrigation development in Saskatchewan except in a small area to the south of the Cypress hills between Robsart and Vidora. A great many small projects mainly for irrigating hay meadows have already been constructed and many new applications for water rights are received each year.

MANITOBA

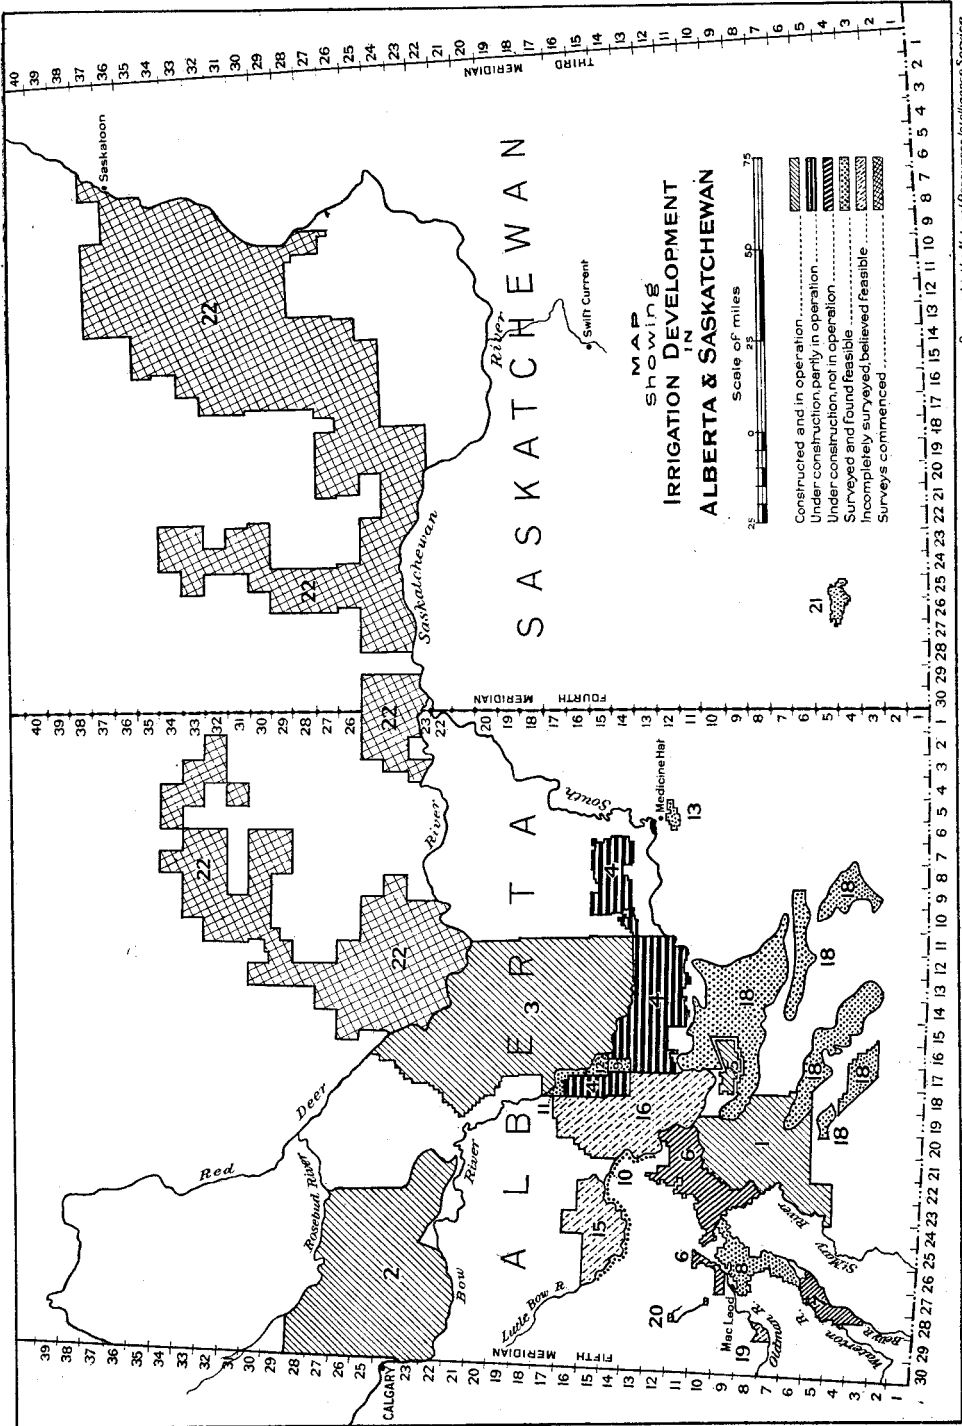

Climatic conditions throughout Manitoba are such that irrigation is not necessary and no appreciable development has taken place. Drainage rather than irrigation is a prime need in this province.

Some further co-operative development in both Alberta and Saskatchewan is to be expected in addition to that at present under way or contemplated. Though the area likely to be affected by this prospective development cannot be predicted with certainty, it will probably be in the neighbourhood of 250,000 acres. A large increase in the number of small private schemes is anticipated in the next few years; in fact developments of this nature are now taking place, 228 applications having been received during the year 1921. The area these schemes may embrace is about 85,000 acres.

The following statement and the map on page 28 are intended to show the extent of the actual proposed and prospective irrigation development in the Prairie Provinces.

IRRIGATION DEVELOPMENT IN WESTERN CANADA

SYNOPSIS OF THE PROVISIONS OF THE IRRIGATION ACT FOR THE GUIDANCE OF APPLICANTS FOR WATER RIGHTS

Preliminary Surveys.—In the majority of cases where water is to be diverted from any source, to be used for domestic or irrigation purposes, a preliminary survey is required to prove the scheme feasible before an application is filed for a water right. If any objection is raised by the owners of land, whose property it may be necessary to cross, the applicant may obtain a license from the Commissioner of Irrigation to make such preliminary survey.

Memorials.—Every applicant for a water right for any of the purposes authorized by the Irrigation Act is required to file a memorial containing information as to the character and location of the works to be constructed and the rights applied for. Blank forms of memorial may be obtained from the Commissioner of Irrigation, Calgary, Alberta.

Permission to Construct Ditches or Other Works Across Road Allowances or Surveyed Highways.—If the proposed scheme includes any crossings over road allowances or public highways the consent must be obtained of the Minister of Public Works for the province within which such works are situated before the works are constructed.

Permission to Construct Works Across Railway Lines.—In cases where the crossing of a railway line by an irrigation ditch or other works is required, permission must be had from the railway company or the Board of Railway Commissioners, as may be required.

Plan to Accompany Applications.—The memorial filed in connection with an application for a water right must be accompanied by both a general and a detail plan, showing the location and character of the proposed works. The general plan should show the location of the works to be constructed and the lands to be irrigated therefrom or which are affected thereby, as a record of the rights applied for, and the detail plan all the main details of the structures to be erected in connection with the proposed undertaking.

Full and specific instructions regarding the preparation of these plans will be forwarded upon application to the Commissioner of Irrigation, Calgary, Alberta.

Notices.—Section 19 of the Irrigation Act provides for the publication of notice of rights applied for. This notice will be prepared by the Commissioner of Irrigation as soon as the application has been approved, and will be forwarded to the applicant with the necessary instructions for publication in newspapers named by the commissioner.

Approval of Application and Authorization to Construct Works.—When the memorial and plans have been approved by the commissioner, the required notice of the application published, and permission has been given to construct the proposed works across road allowances, etc., authorization will be issued for the construction of the works as shown by the memorial and plans filed, and a period of time will be specified within which the works should be completed.

Right of Way for Proposed Ditches or Other Works.—All necessary right of way should be acquired by applicants for water rights before proceeding to construct any works across lands not owned or controlled by them.

To aid in irrigation development the Government grants free right of way over vacant dominion lands. If right of way is required over privately-owned lands, an agreement or easement granting right of way over such land should be secured in triplicate, and submitted to the Commissioner of Irrigation for registration.

Agreements to Use Water from Any Canal, Ditch or Reservoir.—Where it is desired to irrigate from any canal, ditch or reservoir, lands which are not the property of the applicant for the water right, an agreement with each individual owner for the irrigation of such lands must be filed with the Commissioner of Irrigation.

Application to Use Water Through Any Canal, Ditch or Reservoir not the Property of the Applicant.—When an applicant for a water right wishes to take water through another person's works, he must submit a memorial and plans in the usual manner; also an agreement, in quadruplicate, which shall bind the party owning or operating the original works to carry the applicant's water through these works from the point of intake to the point where the applicant's own works commence.

License to Divert and Use Water.—When irrigation works in connection with any application have been completed, and all questions regarding right of way, agreements to use water, etc., have been settled, an inspection of the works will be made by an officer of the Department, and if it is found that the works have been constructed in accordance with the memorial and plan filed, a water license will be issued to the applicant upon payment to the Commissioner of Irrigation of the regulation fee.

NOTE.—For fuller information apply to the Director of the Reclamation Service, Department of the Interior, Ottawa, or the Commissioner of Irrigation, Calgary, Alberta.

MINERALS

Though the Prairie Provinces are properly regarded as primarily agricultural, their yearly mineral production is important. In 1922 it was 15.6 per cent of the Dominion's total. Alberta, with her vast coal areas, yielded about 90 per cent of this, Manitoba 7.4 per cent, and Saskatchewan the remainder.

This mineral wealth, which is largely non-metallic, is admirably located from a domestic viewpoint. In the prairie section where there is an absence of forest fuel and available water-power, coal supplies the need, and the shortage of stone and timber for building purposes is compensated by an abundance of brick clay.

In the more northerly regions prospecting has been carried on only during the last few years, but has resulted in the discovery of gold, copper and lead in northern Manitoba, various minerals such as glass sand, soapstone, kaolin, mineral pigments and gold in northern Saskatchewan, and placer gold in northern Alberta. With improved transportation to these northern fields and more extensive prospecting these areas will yield an increasing share of the annual mineral production of the Prairie Provinces.

Bituminous Sands.

In the vicinity of McMurray, in northern Alberta, occur extensive beds of bituminous or tar sands, containing on an average 15 to 18 per cent bitumen. These beds extend along the Athabaska river for more than 100 miles, and vary from 25 to 200 feet in thickness. Much of the deposit, however, is of little economic value because of the excessive overburden. The bituminous sand has been successfully utilized in its native state for paving, but transportation costs prohibit any extensive use for this purpose. Several companies have leased claims in the McMurray area and are experimenting with the idea of extracting the bitumen and utilizing it for road-making or the production of gasoline, kerosene and lubricating oils by destructive distillation.

Building Stone.

There are two varieties of building stone of outstanding importance, namely, Tyndall limestone from the Tyndall district, north of Winnipeg in Manitoba, and Paskapoo sandstone, which is found in a wide belt bordering the Rockies in Alberta. Some granites and sandstones suitable for building purposes exist east and southeast of lake Winnipeg, and various schists and quartzites in Alberta may also be utilized. Granite and limestone are found in northern Saskatchewan, but in areas far removed from transportation facilities. Limestone, which may be used for road rubble, cement, pulp and paper manufacture, and for lime, is found conveniently situated in Manitoba and Alberta.

Coal.

Coal, by far the most valuable mineral found, is mined in all three provinces. Ranging from anthracite to bituminous and lignite, the output in 1922 comprised about 41 per cent of Canada's total coal production. Alberta, which contains approximately 15 per cent of the world's coal reserve, was first among the coal producing provinces of Canada for 1922, supplying about 95 per cent of the prairie provinces' output, divided as follows: anthracite, 1 per cent; bituminous, 47 per cent; and lignite, 52 per cent. The largest producing fields of the province are in the Lethbridge, Edmonton and Drumheller districts, where lignite is mined chiefly for domestic use, while the Brazeau, Yellow Head Pass, Mountain Pass and Crowsnest Pass fields produce excellent bituminous steam and coking

coals. No anthracite is at present mined at Bankhead. At December 31, 1921, there were 273 mines in operation in Alberta, of which 70 were of large size.

Practically the only coal found to date in Manitoba and Saskatchewan is lignite, most of which occurs in the latter province, which supplies the remaining 5 per cent of the coal production of the Prairie Provinces. Saskatchewan's chief output comes from the Estevan district, in the southeastern corner of the province. Lignite deposits are also found at various points along the Souris river, in the Willowbunch Wood Mountain district, on the South Saskatchewan, about 100 miles southeast of Saskatoon, and at numerous other localities in the province. Briquetting experiments are being conducted at Bienfait, which, it is hoped, will result in the greater utilization of these extensive lignite deposits.

In addition to the reported output numerous small mines and open cuts are operated for domestic consumption in all three provinces. A small tonnage of lignite is obtained in this way from the Turtle Mountain district, the only coal-producing area in Manitoba.

Copper.

Large deposits of this mineral are found in northern Manitoba in the Athapapuskow lake region. The Mandy property has already shipped 26,000 tons of high grade ore to the Trail smelter in British Columbia, and has an estimated reserve of 180,000 tons of 6 per cent copper ore. The Flin Flon claims have been shown by extensive diamond drilling to contain in the neighbourhood of 16,000,000 tons of low-grade copper-zinc-sulphide ore. The proper development of these ores will require, in addition to the usual mining machinery and equipment, a power development scheme, a smelter, and the construction of a railway to link up the area with The Pas. Copper claims have also been staked at lac la Ronge and Beaver lake in northern Saskatchewan.

Clays.

Clays and shales suitable for the manufacture of brick and clay products are quite general, being found at various points in all three provinces. Southern Saskatchewan is fortunate in also possessing the more valuable fire and earthenware clays in abundance. The earthenware clay, which is white, approaches the English ball clay when washed, and is found with fire-clays at such points as Eastend, Readlyn and Willows; fire-clay also occurs at Claybank. A large deposit of kaolin exists near Lake Wapawekka in northern Saskatchewan.

Gold.

Although the actual production of gold in the Prairie Provinces is very small, prospects for an increased yield are excellent. Small amounts of placer gold are recovered from some of the streams in the Peace River district in Alberta, and gold has been reported near Amisk and la Ronge lakes in Saskatchewan, but the most promising gold fields exist in northern and southeastern Manitoba. The copper ores of the Athapapuskow lake region and some claims in the Herb (Wekusko) lake area have already yielded gold in paying quantities, and development work is in progress at Elbow, Copper and Little Herb lakes in northern Manitoba. In the Rice lake, Beaver river and Long lake districts of eastern Manitoba much activity is reported, and in some cases stamp mills have already been installed. Gold claims have also been staked at such places as Wintering, Pipestone, Oxford, God's and Island lakes in Manitoba.

Gypsum.

The only gypsum deposit of present commercial importance is found in Manitoba, northwest of lake Manitoba at Gypsumville, where nearly 39,147 tons were mined during 1922. The beds here are very extensive, over twenty square miles of country underlaid with gypsum being held by the operating companies, thus ensuring a plentiful supply for many years to come.

Gypsum is also widely distributed throughout the northern plains of Alberta, large outcrops occurring on the Peace river near Peace Point and near the brine springs on Salt river.

Natural Gas.

Alberta's yield of natural gas, amounting to over 6,400,000 thousand cubic feet in 1922, is exceeded only by that of Ontario in provincial production. This practically completes the output for the Prairie Provinces, as Saskatchewan produces none and Manitoba a very limited quantity.

The four principal gas fields of Alberta are:—The Medicine Hat field, supplying Medicine Hat, Redcliffe and vicinity with gas for domestic and industrial uses; the Bow Island field, about 40 miles west of Medicine Hat, supplying Lethbridge, MacLeod, Calgary and many other southern Alberta towns; the Viking field, situated nearly 80 miles southeast of Edmonton, which is being developed to furnish gas for Edmonton and the surrounding district; and the Okotoks field which furnishes gas for Calgary. Producing wells are located at various other points in the province, and even in northern Alberta wells have been drilled yielding large quantities of gas, the most notable being that at the mouth of the Pelican river.

The extraction of gasoline from "wet" gas such as that obtained in the Okotoks field, has already been accomplished, as much as 1,200 gallons per day being recovered.

Petroleum.

Alberta is one of the three oil-producing provinces of Canada, the output in 1922 amounting to 6,058 barrels, valued at nearly \$50,631. This production is obtained entirely from the Okotoks field in the Turner valley, southwest of Calgary.

There has been considerable drilling in various parts of Alberta, but with the exception of the wells at Okotoks, and the numerous strikes of natural gas, little success has attended these efforts. There is little doubt, however, that oil in large quantities exists, and many promising fields, such as the Peace river, Ranfurly, Monitor, Wainwright (including Fabyan and Irma), Medicine Hat, Pakowki, Coutts and Calgary districts are being drilled. The developments in the Sweet Grass district in Montana, close to the international boundary, where several producing wells have been brought in, have aroused much interest in the adjoining territory in Alberta.

No oil or natural gas has been discovered in Saskatchewan to date. Some prospecting for oil is going on in the Pasquia Hills area and in the Rush Lake district, near Swift Current.

In Manitoba the search for oil is confined to the Turnberry, Mafeking, Winnipegosis, Dauphin, Stony Mountain and Stonewall districts.

Salt.

Salt is widely distributed throughout the northern part of Alberta, the most notable occurrence being a saline spring near Fort Smith, which has supplied local demands for some years. Extensive beds of salt have also been discovered in the course of drilling operations near McMurray by the Provincial Government of Alberta.

In Saskatchewan small amounts are produced annually from a deposit near Senlac.

Several years ago salt was produced in Manitoba from brine springs occurring in the Dawson Bay area, west and south of lake Winnipegosis and near Mafeking.

Other Minerals.

Silver is present in the copper ores of the Mandy and Flin Flon groups, and silver-lead ore has been discovered at Little Herb lake in Manitoba.

In Alberta a deposit of limonite occurs on the Upper Peace river, toward the head of Halfway river, and promising deposits of sodium sulphate have been investigated near Minburn and Wainwright.

In Saskatchewan near Pipestone (Wapawekka) lake, some 50 miles east of lac la Ronge, occur deposits of soapstone and of a glass sand with a silica content of 98.6 per cent. Some hematite ore is found in the vicinity of Black bay, on lake Athabaska. Oil shales occur in the Pasquia hills and sodium sulphate and associated salts are found in the beds of partially dried-up lakes at or near Muskiki lake, Ceylon, Fusilier, Viceroy, Court, Dunkirk, North Battleford, Dana, and many other places.

A deposit of mica is reported in Manitoba about 15 miles east of lac du Bonnet, near the nickel-copper claims two miles east of Oiseau lake. An occurrence of tungsten-molybdenum ore is reported in the Falcon Lake district, and silica is found north of Swan river and near Black island, while pure quartzite has been observed 125 miles northwest of Winnipeg. Large areas of shales carrying small quantities of oil are found along the escarpment of the Pembina. Riding, Duck and Porcupine mountains.

SYNOPSIS OF REGULATIONS GOVERNING THE GRANTING OF MINERAL RIGHTS

Alkali Mining.—Dominion lands containing natural accumulations of soluble mineral salts and associated marls may be leased by the minister at an annual rental of twenty-five cents an acre. The term of the lease shall be twenty years, renewable for a further term of twenty years. Not more than 1,920 acres shall be leased to one applicant. A fee of ten dollars and the rental for the first year shall accompany each application for a lease. A royalty of twelve and a half cents per ton on solid products and two cents per gallon on salts in solution shall be charged, with certain reservations, on all raw or refined products shipped.

Coal.—Coal mining rights may be leased for a period of twenty-one years, renewable for a further period of twenty-one years, at an annual rental of one dollar an acre. Not more than 2,560 acres shall be leased to one applicant. A royalty at the rate of five cents per ton shall be collected on the merchantable coal mined.

A fee of five dollars shall accompany each application for a lease.

Coal mining rights, for domestic purposes but not for sale, may be acquired at an annual rental of five dollars. This permit may be renewed from year to year. Not more than one acre shall be disposed of to one applicant. A royalty of twenty-five cents shall be collected on each ton of merchantable coal mined.

Limestone, Granite, Slate, Marble, Gypsum, Marl, Gravel, Sand, Clay or any Building Stone.—Dominion lands containing these materials may be leased by the minister at an annual rental of one dollar per acre for the purpose of quarrying out and removing therefrom stone or other material mentioned herein.

The term of the lease shall be twenty-one years, renewable for a further period of twenty-one years.

The maximum area of the quarrying location shall be forty acres, and no person shall be allowed to lease more than one location.

Application for a location comprising surveyed land shall be filed by the locator in person with the Agent of Dominion Lands for the district in which the location is situated. In unsurveyed territory location is to be staked out.

A fee of five dollars shall accompany each application for a lease.

Clay locations are leased upon the condition that a plant suitable for the manufacture of brick or other clay products shall be erected within two years from the date of the lease, and, further, that in each year of the term of the lease after the second year there shall be produced ready for shipment not less than one hundred thousand bricks or their equivalent in some other form.

Petroleum and Natural Gas.—The petroleum and natural gas rights, which are the property of the Crown, may be leased to applicants at a rental of fifty cents per acre for the first year, and for each subsequent year at the rate of one dollar an acre. The term of lease shall be twenty-one years, renewable for a further term of twenty-one years. The maximum area of a location shall be 1,920 acres.

Provision is made for the installation of machinery within fifteen months, and if machinery is installed the minister may grant an extension of time to pay rental. Expenditures incurred in boring operations, exclusive of the cost of machinery and casing, may be accepted in lieu of rental. A number of leaseholds, comprising not more than twenty thousand acres, not separated by a greater distance than two miles, may be grouped and expenditures on one leasehold accepted in lieu of rental for all leases in the group.

Application for a lease shall be made by the applicant in person to the Agent of Dominion Lands for the district in which the rights applied for are situated, or to a sub-agent for such district for transmission to the agent. In case the location is in unsurveyed territory it shall be staked out by the applicant in person.

A fee of five dollars and the rental for the first year shall accompany each application for a lease.

Placer Mining.—Any person over eighteen years of age may enter for mining purposes, locate, prospect and mine for minerals upon any lands the right to which entry, prospecting and mining is vested or reserved to the Crown with certain exceptions.

An application for a grant of a claim shall be filed with the mining recorder within ten days after the location thereof, if the claim is located within ten miles of the mining recorder's office. One extra day shall be allotted for every additional ten miles, or fraction thereof. The fee for recording a claim is ten dollars.

Claims are designated as creek, river, or inland, all of which shall be as nearly rectangular as possible. A creek claim shall not exceed five hundred feet in length along the stream and one thousand feet in width on each side of it, and a river claim, which shall only cover one bank, may have an extreme length of five hundred feet along the river and a width of one thousand feet. An inland claim shall not exceed five hundred by one thousand feet. A person or party locating the first claim on any creek, river, hill, bench, bar, or plain shall be entitled to a claim or claims respectively, as follows:—

One locator, one claim 1,500 feet long; two locators, each one claim 1,250 feet long; more than two locators, two claims of 1,000 feet each and ordinary claims for the remainder of the party.

If any person satisfies the recorder that he is about to undertake a bona fide prospecting trip and files the power of attorney from not more than two persons authorizing him to stake for them in consideration of their having enabled him to undertake the trip, he may stake one claim of ordinary size in the name of

each such person within the valley or basin of any creek or river bench upon which he makes a discovery. This last-mentioned rule applies also in the staking of quartz claims.

Quartz Mining.—Any person having discovered mineral in place may locate a claim 1,500 by 1,500 feet by marking out the same with three legal posts, one at each end of the location line, and a third at the spot where the mineral in place has been discovered. The two location posts must have the name of the claim, a description of the ground, date of location, and locator's full name written legibly upon them. The discovery post shall be marked "Discovery Post," and No. 1 post marked "Initial Post."

The claim shall be recorded within fifteen days if located within ten mile of a mining recorder's office; one additional day is allowed for every additional ten miles or fraction thereof. The fee for recording a claim is ten dollars.

At least one hundred dollars must be expended on the claim each year or paid to the Mining Recorder in lieu thereof. When at least five hundred dollars have been expended or paid, the locator may, upon having a survey made, and upon complying with other requirements, lease the mineral rights. Permission may be granted to group any number of adjoining claims up to eight in number for representation work, upon taking out a certificate of partnership before the commencement of the work. (See also under placer mining.)

There are also regulations governing the issue of leases to dredge for minerals in the beds of the rivers; the leasing of deposits of potash on Dominion lands; the granting of permits to remove sandstone and gravel from beds of rivers and lakes; and regulations relating to bar diggings on the North Saskatchewan river.

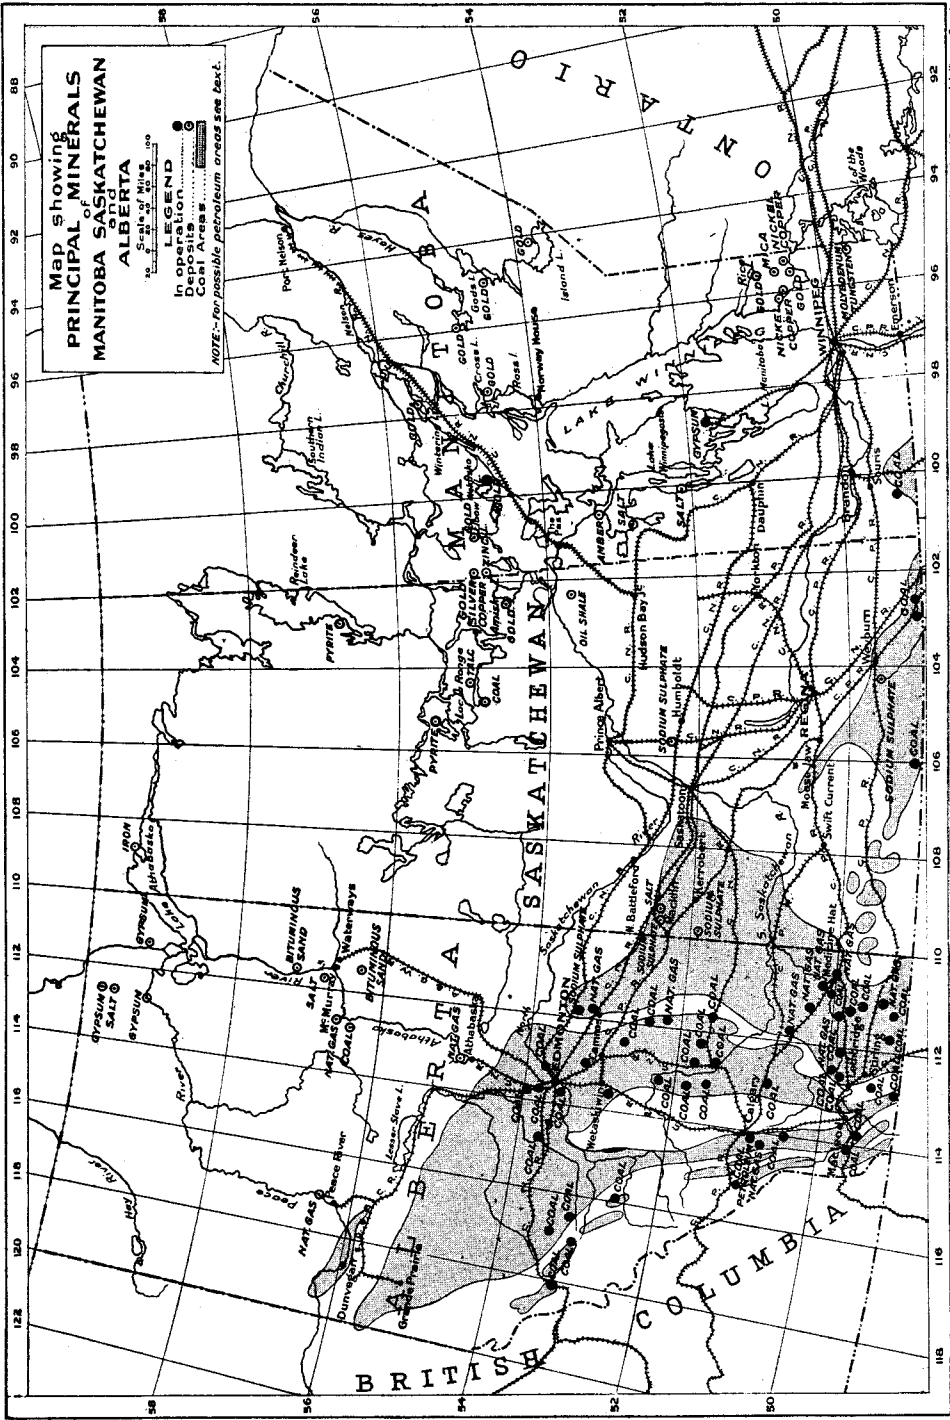

- NOTES.—(1) All rentals must be paid yearly in advance. Fees accompanying an application for a lease will be returned only if the rights applied for are not available.
 (2) For petroleum and natural gas regulations in the Yukon Territories write the Northwest Territories and Yukon Branch.
 (3) For other information regarding the various acts covered in the above synopses write the Mining Lands Branch, Department of the Interior, Ottawa.

MINERAL AREAS AND QUARRY LANDS SOLD UP TO MARCH 31, 1922, AND AREAS HELD UNDER MINING LEASES AT THAT DATE IN THE PROVINCES OF MANITOBA, SASKATCHEWAN AND ALBERTA

FORESTS

Though it may seem like a paradox to refer to the forests of the Prairie Provinces, the wooded sections in each province are nevertheless very extensive, actually covering in the case of Manitoba almost 70 per cent of the total area of the province.

Recent estimates of the commercial timber stands of the three provinces range from eight to eleven million acres and the commercial saw timber from thirty-three to forty-two billion board feet. This estimate neglects much of the northern area, with its more or less scattered scrubby growth, an area, however, which must not be underestimated in value, for it is both a potential source of small timber and pulpwood for the future, and a cover for game and fur-bearing animals.

The principal merchantable species include spruce, poplar, jackpine, tamarack, birch and balsam, while other species such as lodgepole pine, willow, cottonwood, ash, elm, maple, and oak are also found in varying numbers. Domestic consumption accounts for nearly all the production of the lumber mills which are located at central points throughout the timber regions in all three provinces. In 1921 there were 36 sawmills operating in Alberta, 16 in Saskatchewan and 27 in Manitoba.

Forest reserves are maintained in the Prairie Provinces to the extent of 18,894 square miles in Alberta, 9,303 in Saskatchewan and 3,729 in Manitoba. These reserves are still being added to and changed as careful surveys demonstrate the need. The policy of the Forestry Branch of the Department of the Interior has been to include in the forest reserves areas unfit for agriculture, but capable of being developed from waste areas to productive ones by reforestation methods, and to release land which is better suited for agriculture than tree growing. The reserves have been established, not with the idea of keeping the timber and other resources within them from use, but to supply, for all time, the largest quantity of the best timber that can be produced. A certain amount of fuel and building logs are given the nearby settlers, and permits are granted, on payment of a nominal fee, to cut timber for domestic, community and various other uses. Stands of fire-killed or over-mature timber are also sold to expedite the reforestation of the area concerned. The open spaces are leased to the settlers for grazing purposes, and the utilization of the reserves for camping, fishing and recreation purposes is encouraged.

The Forestry Branch maintains fire patrols in the reserves and on the timbered areas outside them; much good work is being done by the fire rangers in educating the campers, hunters and trappers to exercise care with their campfires, and in forcing timber cutters to clear up their slash. Every effort is being made to reduce the forest fires which every year take such toll of valuable timber; lookout towers are located at various points to assist the rangers in the early location of fires and aeroplane patrols have recently been established which have proved of great value not only in combating forest fires but in various timber surveys and photographic work.

The tree planting division of the Dominion Forestry Branch with headquarters and chief nursery at Indian Head, Saskatchewan, and a subsidiary nursery at Sutherland, near Saskatoon, is doing splendid service in fostering prairie tree planting. Expert advice as well as tree seed, seedlings and transplants are supplied, with the result that many ranches have been beautified, much soil drifting prevented, valuable wind breaks established to protect both crops and live stock, and work of reforesting the forest reserves advanced.

It is probable that domestic markets will continue largely to absorb the products of the lumber mills of the Prairie Provinces, but on the other hand the vast supplies of pulpwood will doubtless be utilized in the near future to swell the total of Canadian exports of pulp and paper.

Timber lands in the Prairie Provinces are administered as follows: The forest reserves are controlled by the Forestry Branch, Department of the Interior; the timber on Dominion lands, excepting that located in parks and forest reserves but including timber limits leased before the reserves were established, are administered by the Timber and Grazing Lands Branch, Department of the Interior, while forests in Dominion parks are administered by the Canadian National Parks Branch, Department of the Interior.

ALBERTA

Alberta's timber wealth is found chiefly in the mountain and foothill country of the southwest, the broken head-water country of the Alberta rivers, and the northern half of the province.

The principal timber producing areas now available are found in the Rocky Mountains reserve. The northern regions are wooded, some good timber being found bordering the lakes, but due to transportation difficulties most of it is at present inaccessible; some lumber, however, is cut for local needs in the Peace River district.

Spruce provides the greater proportion of the annual cut to which smaller amounts of lodgepole pine, jack pine, balsam fir, poplar, tamarack and white birch contribute.

There are four forest reserves in Alberta, comprising an area of 18,894 square miles; Rocky Mountain, 13,730; Lesser Slave, 5,023; Cypress Hills No. 1, 81; and Cooking lake, 60. The Rocky Mountains reserve is divided, for administrative purposes, into four units, namely, Crow's Nest, Brazeau, Clearwater, and Athabaska.

As in the other provinces forest fires have wreaked terrible havoc among Alberta's forests, destroying much valuable timber. However, with improved methods of fire control, including the use of aeroplanes, and wise administration, the forests of Alberta will realize a large annual revenue.

SASKATCHEWAN

About one-third of the province consists of wooded areas, only a small portion of which is composed of commercial timber. This timber is largely contained in a belt stretching across the central part of the province, bounded on the north by the Churchill river and extending southerly to Prince Albert, on the Saskatchewan river. From Prince Albert it extends southeast, reaching below the river to the eastern boundary of the province, while the western section barely reaches the Saskatchewan. The northern part of the province is also wooded, but with the exception of some good timber in the valley of the Clearwater river and near the shores of lake Athabaska the forest growth is small and inferior. Estimates of the size of the merchantable timber stands range all the way from one to three million acres.

Saskatchewan ranks second in the lumber production of the Prairie Provinces, the centre of the industry being at Prince Albert. The cut is composed largely of spruce, the remainder being tamarack, poplar and jack pine. Other varieties found in Saskatchewan are balsam and white birch. Large reserves of pulpwood are available in this province, which are not being utilized at present.

There are 17 forest reserves in the province with a total area of 9,303 square miles, distributed as follows, areas in each case being in square miles: Porcupine No. 2, 2,870; Pasquia, 2,615; Big River, 1,342; Sturgeon, 729; Fort à la Corne,

513; Manito, 180; Pines, 165; Moose Mountain, 156; Nisbet, 149; Elbow, 119; Beaver Hills, 99; Cypress Hills No. 2, 98; Keppel, 86; Duck Mountain No. 2, 81; Dundurn, 63; Seward, 31; and Steep Creek, 7.

MANITOBA

Of Manitoba's total area nearly three-quarters is wooded, the only parts of the province not bearing extensive forest growth being the southern prairie section and the extreme northern parts. Even in the southern districts are found some scattered clumps of trees and two forest reserves offer promise of more abundant timber for this sector. North of the prairies the forests are general, the best timber being found in the river valleys, on the islands, high plateaus and hilly regions, and around the shores of the lakes. The timber in the area tapped by the Hudson Bay railway is scattered and has been terribly depleted by the ravages of forest fires. In fact, nearly all the forests of Manitoba have suffered from this scourge, but in most places a second growth is flourishing. From The Pas, north, very little saw timber is found, although large quantities of mine timbers, ties and pulpwood are available. The extreme northern section supports a sparse stunted growth suitable for firewood.

Manitoba possesses large pulpwood resources, several areas presenting favourable conditions including abundance of water-power for the manufacture of pulp and paper. Among these may be mentioned the district between Lac du Bonnet and Black river, the one in the vicinity of Grand Rapids on the Saskatchewan river and the section along the line of the Hudson Bay railway from The Pas to Wintering lake. These areas will doubtless be called on to supply their share of Canada's pulp production in the future.

The forest flora of this province is varied. In the southern sections, oak, ash, poplar, elm, basswood, and maple are found while in the more northerly regions spruce, jack pine, tamarack, balsam, birch and poplar predominate.

Manitoba has first place in the lumber production of the Prairie Provinces, her output consisting of spruce, jack pine, poplar, birch, tamarack and balsam. Some of this production, however, should be credited to Saskatchewan, as much of the timber cut at The Pas is obtained from the Carrot and Sipanok river valleys in Saskatchewan.

Manitoba's five forest reserves cover an area of approximately 3,729 square miles. They are enumerated below, all areas being given in square miles. Duck Mountain, 1,462; Riding Mountain, 1,159; Porcupine No. 1, 775; Spruce Woods, 224; Turtle Mountain, 109.

SYNOPSIS OF REGULATIONS GOVERNING THE GRANTING OF TIMBER BERTHS IN THE PRAIRIE PROVINCES

Timber berths shall be disposed of by public auction at the office of the Dominion Timber Agent for the district in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles.

No berth shall be disposed of until notice of the sale has been given for a period of not less than sixty days in a newspaper published in the district in which the berth is located and also in a newspaper having a general circulation in the province.

Purchases shall be paid part in cash and balance covered by notes bearing interest at rate of 6 per cent per annum.

The licensee shall be entitled to a renewal of his license from year to year subject to the regulations in force at the time renewal is made, while there is on

the berth a sufficient quantity of merchantable timber as described in the license, and provided the terms and conditions of the license, and the provisions of the Dominion Lands Act, and regulations have been fulfilled.

The licensee shall pay an annual ground rent of ten dollars per square mile, and one-half of the cost of fire protection for his berth.

Timber for Homesteaders.—Any occupant of a homestead quarter-section having no suitable timber of his own and who had not obtained a free allowance of timber from Dominion lands may, providing application is made within five years of date of his homestead entry, obtain a free permit to cut a stated quantity of building timber, fencing timber or any fuel such as he may require for use on the land he owns and occupies. If he requires a further quantity for the purpose mentioned he must pay the specified dues.

Permit berths are granted covering one square mile under certain conditions contained in section 41 of the Timber Regulations.

For more detailed information regarding the granting of the right to cut timber on Dominion lands write to the Controller of the Timber and Grazing Lands Branch, Department of the Interior, Ottawa, or to the local Crown Timber Agent.

SYNOPSIS OF REGULATIONS GOVERNING THE GRANTING OF PULPWOOD BERTHS

Pulpwood berths shall be disposed of by tender at the office of the Crown Timber Agent for the district, after having been advertised for not less than ninety days in at least two newspapers having a general circulation in the province in which the berth is located.

The Minister shall decide the area of the berth and whether a survey of the boundaries may be necessary.

Pulpwood dues shall be paid at the rate of 60 cents per cord.

The tenderer shall be required to deposit with his tender a marked cheque drawn on a chartered bank of Canada, payable to the Deputy Minister of the Interior, for a certain amount which shall be forfeited in the event of his not entering into agreement to carry out the conditions attached.

The licensee shall pay an annual rental at the rate of \$1 per square mile, due in advance on the 1st May. The licensee shall also pay one-half the cost of fire-protecting his berth.

For further detailed information regarding the granting of the right to cut pulpwood on Dominion lands write to the Controller of the Timber and Grazing Lands Branch, Department of the Interior, Ottawa, or to the local Crown Timber Agent.

FISHERIES

The fisheries of the Prairie Provinces, in point of production, have advanced very little in the past few years, chiefly owing to the semi-exhaustion of some of the smaller lakes through over-fishing and the restrictions placed on many of the large fishing areas limiting the quantity of fish which may be caught in a season. While this latter phase may be looked on as a hardship by some, yet it is a necessity if the fisheries are to be maintained.

The most interesting feature of these fisheries during this period is the increased share of the output supplied by Alberta and Saskatchewan. These provinces, possessing about one-third the total Prairie Province lake area, have increased their quota of the annual production from about 25 per cent in 1908 and 20 per cent in 1915, to 38 per cent in 1922. This has been due in great measure to the extension of the fisheries to include in their cycle of operations many of the more important northern lakes. This in turn has been made possible by improved methods of transportation in the northern regions, namely, the railway extensions reaching McMurray and Peace River in Alberta and Big River in Saskatchewan, and the Hudson Bay railway in the The Pas district.

In all three provinces the numerous lakes and rivers, amounting to nearly 31,000 square miles in area, abound in valuable food fishes. Whitefish, the most abundant species, is unexcelled in quality and is in great demand, while pickerel, tullibee, lake trout, pike, goldeyes, and sturgeon, with its attendant product caviare, also find a ready market. Other varieties include perch, mullet, cat-fish and ling.

The greater part of commercial fishing takes place in the winter season, when the chilled or frozen fish may be shipped to distant points. This winter catch is marketed in the Canadian interior and adjoining American states. A large demand has been created in Chicago and numerous other middle western cities, while occasional shipments have been made to such distant points as Montreal and New York. Some summer fishing also takes place, the catch being marketed in the nearby towns.

The fishing enterprises are well organized, operating collecting stations and chilling plants at central points and using motor launches, teams and sleighs to convey the packed fish to the nearest railway station. A fishing fleet of steam tugs, gasoline launches, sail boats and skiffs is also maintained, the total outlay in boats, gear, icehouses, fish-sheds and wharves reaching over three quarters of a million dollars in 1922.

Considerable progress has been made in fish culture, with five hatcheries supplying eggs and fry. In Manitoba there are three, the one at Gull Harbour, lake Winnipeg, propagating whitefish and pickerel, those at Dauphin river and at Snake island, whitefish alone. The Saskatchewan hatchery located at Qu'Appelle also distributes whitefish, while that at Banff, Alberta, specializes in game fish, namely atlantic salmon, ouananiche, rainbow, cut-throat and salmon trout.

The future of the fishing industry in the Prairie Provinces depends largely on the more extensive exploitation of the prolific northern lakes and a more intensive system of restocking, which will allow a greater catch to be marketed annually without depletion.

MANITOBA

The southern portion of Manitoba with its better transportation and larger proportion of the 20,000 square miles of the whole lake area yields the great bulk of the provincial output.

The principal fishing areas in order of their importance are lakes Winnipeg, Winnipegosis, The Pas district and lake Manitoba. Other fishing districts of less importance are lakes St. Martin, Waterhen, Dauphin and Red Deer, and Buffalo bay in the Lake of the Woods.

The fishing industry of the northern lakes with The Pas as shipping centre is steadily becoming more valuable as transportation improves. Lakes Moose, Cormorant and Cumberland are also important producers and the Hudson Bay railway is bringing many more within range of the markets.

The largest single item in the fish production of Manitoba is whitefish, followed in order by pickerel, tullibee, pike, sturgeon, goldeyes and trout. Whitefish, pickerel, tullibee and pike are in nearly all the important lakes, goldeyes chiefly in lakes Winnipeg and Winnipegosis. Sturgeon are caught in such northern lakes as Cumberland, Namew and Sipiwesk, but also in lake Winnipeg. The northern lakes are the main habitat of the trout.

MANITOBA FISHING LICENSES

The following are the different kinds of licenses issued in the province of Manitoba:—

Settler's Permit.

Commercial Sturgeon Fishery License.

Domestic Sturgeon Fishery License.

Special Angling Permit for Non-Residents.

Under the special fishery licenses all licenses for commercial fishing, with the exception of sturgeon, are issued on the one form with fees varying according to kind and requirement, a separate license being required for catching each kind of fish.

Settler's Permit.—Any resident settler, including Indian, may secure a fishing permit to fish with not more than one hundred yards of gill-net, or with a dip-net or with not more than fifty baited hooks for domestic use, but not for sale or barter. Such permit shall be issued free.

Special Fishery License.—A commercial license for dip-net fishing shall authorize the use of one dip-net for the capture of suckers and other coarse fish not protected by a close season. The fee on such license shall be two dollars.

Commercial fishing is allowed in the larger lakes of Manitoba, and in most cases a limit is set on the amount of fish that may be taken during the summer or winter season, on the amount of fishing contrivance to be used, and on the time the various kinds of fish may be taken. The fees range from two to fifty dollars.

Commercial Sturgeon Fishery License.—A sturgeon fishing license for commercial fishing shall authorize the use of not more than five hundred yards of gill-net or five hundred baited hooks. The fee on such license shall be five dollars.

Domestic Sturgeon Fishery License.—A sturgeon fishing permit for domestic fishing shall authorize the use of not more than one hundred yards of gill-net or fifty baited hooks, and under this permit not more than three sturgeon may be taken in one week.

Catfish Fishery License.—A license to authorize the use of not more than five hundred baited hooks or five hundred yards of net for the summer capture of catfish may be issued for any of the waters of the province. The fee on such license shall be three dollars.

Special Angling Permit for Non-Residents.—No one other than a British subject resident in the province, or a resident settler including Indians, may fish by angling without a permit, the annual fee of which shall be five dollars.

SASKATCHEWAN

Saskatchewan contains about 8,500 square miles of lakes, mostly in the northern half of the province. The clear, cold waters of these northern lakes produce fish unexcelled in quality and flavour which command the highest prices in the markets of Canada and the United States.

The most prolific fisheries are those of the Doré, Montreal and Turtle lake districts, and fishing is also an industry in such lakes as Waterhen, la Ronge, Jackfish and Okemasis.

The most important species taken include whitefish, pike, pickerel and trout. Whitefish, which form a large proportion of the annual catch, together with pike and pickerel, are found in nearly all the more important lakes; trout chiefly in la Ronge, Montreal and Doré lakes.

ALBERTA

The larger commercial fisheries of Alberta are also confined to the more northerly lakes, a very great part of the annual provincial output coming from the Lesser Slave and Peter Pond (Buffalo) lake districts in this area. Other fishing districts include Trout, Athabaska, la Biche, Pigeon and Cold lakes.

Whitefish, pickerel and pike are general in the larger lakes, trout principally in Athabaska, Cold and Lesser Slave lakes.

SASKATCHEWAN AND ALBERTA FISHING LICENSES

There are four classes of licenses issued, namely, domestic, fisherman's, commercial and sturgeon.

Domestic Fishery License.—Any resident who is a British subject or a bona fide homesteader may secure a domestic license, entitling him, or a member of his family, to fish with not more than sixty yards of gill-net, or with one hoop-net and a set line of not more than twenty baited hooks.

Fish caught under this license shall be for home consumption only and not for sale or barter. The annual fee for this license shall be two dollars.

Indian and Half-breed Permit.—Any Indian or half-breed resident may secure an annual permit, free, to fish with not more than sixty yards of gill-net for domestic use, but not for barter or sale. Fishing for necessary daily consumption, but not for curing or hanging, may be carried on during the close seasons.

Fisherman's and commercial licenses are issued on the one form headed *Commercial and Fisherman's Fishery License* and fees are charged according to the requirements governing the kind of fish caught, a separate license being required for catching each kind of fish.

Fisherman's License.—Any resident who is a British subject or a bona fide homesteader may secure a fisherman's license, entitling him to fish with not more than three hundred yards of gill-net or two hoop nets or a set line having not more than 200 baited hooks in the waters stated in the license. The fee for this license shall be five dollars.

Commercial License.—Any resident who is a British subject may secure a commercial license, entitling him to fish with not more than six hundred yards of gill-net in the waters stated in the license. The fee for this license shall be ten dollars. Such license will be issued for the larger lakes only and will be good for the season—summer or winter only—for which it is issued.

An Indian or half-breed permit, domestic license, fisherman's license or commercial license shall authorize the taking of all kinds of fish except sturgeon.

Commercial Sturgeon Fishery License.—A sturgeon commercial fishing license shall authorize the use of not more than five hundred yards of gill-net or five hundred baited hooks for which the annual fee is five dollars.

Domestic Sturgeon Fishery License.—A sturgeon domestic fishing permit, under which not more than three sturgeon may be taken in one week, shall authorize the use of not more than one hundred yards of gill-net or fifty baited hooks.

Special Angling Permit.—Angling or trolling in waters frequented by trout, grayling or rocky mountain whitefish is prohibited except by permit. This annual permit fee is two dollars for British residents, and one dollar for a single day or five dollars for the season for non-residents.

For more detailed information regarding fishing regulations in Alberta, Saskatchewan and Manitoba write to the Department of Marine and Fisheries, Ottawa.

WATER POWERS

Cheap power is a resource essential to the development of other natural resources. Water-power is a prime mover which can be used directly for mechanical operations or indirectly through the medium of electricity. In other words, power can be used either at the site or at a distance therefrom. Improvements in electrical transmission have greatly widened the effective radius of water-power and have brought distant markets hitherto unsupplied within reach of the power site.

Alberta, Saskatchewan and Manitoba are peculiarly fortunate in having within their boundaries important water-powers and fuel resources. With the proper co-ordination of the administration, investigation and exploitation of these two resources there need be no doubt about the fuel and power needs of the three provinces being adequately met.

In the southern and most thickly populated portions of these provinces where agriculture is the principal industry, the river gradients are flat and opportunities for water-power development are few. In the Rocky mountains, however, and in the Laurentian formations of northern Alberta and Saskatchewan and northern and eastern Manitoba, there are many large rivers with numerous and important power sites readily feasible of development. The Bow and upper Saskatchewan in the west; the Peace, Athabasca, Slave, Churchill, Reindeer, Saskatchewan, and Nelson in the north and the Winnipeg in the east, afford vast power possibilities which only await a market for their complete development.

In northern Saskatchewan and in northern and eastern Manitoba recent discoveries of valuable mineral deposits will doubtless provide a market for a considerable development of hydro-electric power, while untouched resources of timber throughout the north will require the development of many of the water-powers for their proper exploitation.

Utilization of water-power has so far been confined chiefly to areas surrounding the centres of Winnipeg and Calgary. On the Winnipeg river the city of Winnipeg and the Winnipeg Electric Railway Company have installations which total 105,000 horse-power, and a further development is in course of construction for the Manitoba Power Company which will have an initial installation of 56,000 horse-power and an ultimate capacity of 168,000 horse-power. This power is transmitted to Winnipeg and is also utilized as far west as Portage la Prairie and as far south as Carman and Morden. The industrial expansion of Winnipeg which has been most marked in the past ten years has resulted from an adequate supply of cheap hydro-electric power. On the Bow river the Calgary Power Company possesses two hydro-electric developments with installations totalling to 31,500 horse-power. These plants together with a small installation on the same river owned by the Calgary Water Power Company provide the city of Calgary with a very valuable supply of cheap hydro-electric power. Other small water-powers have been developed among which may be mentioned two on the Minnedosa river supplying in part the requirements of Minnedosa and Brandon, also two owned by the Canadian Pacific Railway Company in Alberta, one supplying the demands of their hotel at lake Louise and the other operating the mechanical equipment of their irrigation dam at Bassano.

A complete investigation of the power possibilities of the Prairie Provinces has by no means been made and detailed information is available for only a few of the possible power sites. Sufficient general information has been gathered, however, to permit of a fair estimate of the amount of power available on the main rivers.

The following table outlines briefly the power available on the main rivers of Manitoba, Saskatchewan and Alberta.

*Development under construction at Great Falls.

The water-powers of the Prairie Provinces are administered by the Department of the Interior through the Dominion Water Power Branch in accordance with the Dominion Water Power Act of 1919 and regulations pursuant thereto made by Order in Council of October 31, 1921. A brief summary of these regulations follows:—

SYNOPSIS OF DOMINION WATER POWER REGULATIONS

1. Every applicant for a license to divert, use or store water for power purposes shall file with his application to the Director of Water Power physical, financial and other information as outlined in the regulations.

2. Publication of notices of this application and local hearings in regard thereto may be required.

3. A survey permit if necessary may be issued to the applicant to enable him to make the surveys and investigations necessary to the preparation of general lay-out plans. This conveys no priority to the applicant.

4. A priority permit may be issued in regard to the consideration of preliminary lay-out plans. This priority is limited to one year but may be extended under certain conditions; it is not granted unless the preliminary information as to the feasibility of the scheme and the financial ability of the applicant is satisfactory. Priority permits are designed to protect the applicant where the surveys and investigations necessary to the preparation of general lay-out plans will involve considerable expense; the permit does not lay the Minister under any obligation to grant a concession.

5. If the general lay-out plans are satisfactory and the Director recommends the granting of a concession the Minister may issue an Interim License designed to cover the construction period of the works. This license embodies the special terms of the concession in regard to construction plans, expenditures, power to be developed, date of completion, etc., and, by reference, incorporates the regulations in force at the time of its issue.

6. After the issue of the interim license, general construction plans must be submitted and approved, certain rentals and deposits also become due, and there is provision for inspection; extensions of time; penalties for default; operation pending issuance of final license; also other appropriate provisions for the protection of the Crown and of the interim licensee.

7. Upon the satisfactory completion of the development the Minister is required to issue a Final License, the term of which shall not exceed fifty years. There is provision for renewal or termination of this license. If the license is terminated, compensation is provided upon the basis set forth in the regulations. Rentals based upon the capacity of the installation are imposed; the rental is subject to revision at the end of the first twenty years of the license and every ten years thereafter; the principles of such revision and the protection provided to the licensee are set forth in the regulations. The regulation of rates charged to consumers is also provided for.

8. Other provisions concern: care of lands; maintenance and operation of works; increase of output up to capacity; securing enlarged development; stream regulation and control; appraisals; accounting; transfers; penalties for default; and also some miscellaneous provisions.

9. Where the application is for a small water-power not exceeding 500 horse-power capacity special simplified regulations may be promulgated, but in such case the term is reduced to twenty years, with renewals for further periods not exceeding five years each; no compensation is provided unless the development is taken over before expiry of the term.

For more detailed information regarding water-power regulations write Dominion Water Power Branch Department of the Interior, Ottawa.

PARKS

The Canadian National parks cover an area of nearly 10,000 square miles of the finest scenery on the continent, of which more than 7,500 square miles are located in the Prairie Provinces. This great area which was primarily set aside for the benefit and enjoyment of the people of Canada has developed into one of the greatest revenue-producing resources of the country.

The growing popularity of the parks both to Canadian and foreign tourists is clearly shown in the increasing number of visitors to the great mountain areas each year. During the fiscal year ending March 31, 1922, over 175,000 tourists visited the parks and of these 65,000 were from foreign countries. On the basis of an estimated expenditure of \$300 each by visitors coming into the country, tourist traffic to the parks from foreign countries represented a revenue of \$19,500,000, while approximately \$15,000,000 was kept in the country by attracting Canadians to their own parks.

Sanctuary conditions in the parks have brought about a wonderful increase in wild life in these areas. Bears, moose, deer, and many other animals, together with a variety of birds may be seen from the motor roads and trails throughout the parks.

The administration of the Migratory Birds Convention Act also comes under the Commissioner of Canadian National Parks. Certain areas of marsh lands and lake and river shore are set aside as breeding grounds for migratory birds in which they are protected the year round. Eighteen sanctuaries have already been reserved in the west and many other areas are under consideration.

The following areas are administered by the Canadian National Parks Branch:—

SCENIC PARKS AND RESERVES

Name of Park	Location	Areas
Banff National.....	Alberta, east slope of Rockies....	2,751 sq. miles
Jasper.....	Northern Alberta.....	4,400 "
Waterton Lakes.....	Southern Alberta adjoining United States Glacier Park.....	220 "
Vidal's Point.....	Saskatchewan.....	17 acres
Little Manitou Lake (Recreational area).....	Saskatchewan.....	Vacant lands around lake
Brereton Lake " "	Manitoba.....	" "
Falcon lake " "	Manitoba.....	" "
Nora Lake " "	Manitoba.....	" "
West Hawk Lake " "	Manitoba.....	" "
Fort Pelly " "	Saskatchewan.....	800 acres

ANIMAL PARKS

Buffalo park.....	Near Wainwright, Alta.....	159 sq. miles
Elk Island park.....	Near Lamont, Alta.....	51 "
Nemiskam antelope reserve.....	Southern Alberta.....	9 "
Wawaskesy antelope park.....	Alberta.....	54 "
Menissawok antelope park.....	Saskatchewan.....	17 "
Moose Mountain buffalo reserve.....	Saskatchewan.....	1,440 acres

HISTORIC SITES

Fort Prince of Wales.....	Churchill, Man.
Battlefield of Fish Creek.....	Batoche, Sask.
Frog Lake Massacre.....	Near Lloydminster, Sask.

Manito lake, Saskatchewan.....		56

FURS AND GAME

In their immense areas of country with its varied topography the Prairie Provinces have rich resources in wild fur-bearers and game. The appreciation of fur in the world of fashion and commerce and the desire of thousands of people under the strain of modern business to mingle with nature in the pleasures of fishing and hunting, give to wide stretches of country that are the natural haunts of wild life both a commercial value and a value that dollars can never convey. The total value of pelts taken in Canada during the season 1921-22 was \$16,458,621 to which Manitoba, Saskatchewan and Alberta contributed \$1,679,646, \$1,673,679 and \$1,356,338 respectively. The fur-bearers contributing for the most part to these figures were in order of value, muskrat, beaver, mink, marten, and fox (red, cross, white, black and silver).

Through legislation and the co-operation of the federal and provincial governments and various private organizations in the protection of all kinds of birds and fur-bearing animals benefits have resulted not only to the community as a whole but also to individual trappers, traders and hunters, and it is confidently hoped that under wisely applied methods of conservation the fur and game wealth of the Prairie Provinces will be permanently maintained and increased. In recent years the status of western Canada's commerce in fur has improved as a result of the regular auction sales that now attract buyers from many countries.

Revenue.

The following table gives the revenue obtained by the provincial governments from the issuing of licenses to sportsmen and farmers for hunting big game and game birds. This revenue has increased latterly on account of legislation which imposes certain fees and taxes on those engaged in the commerce in furs:—

Province	1915		1920		1921	
	Number of Licenses	Revenue	Number of Licenses	Revenue	Number of Licenses	All Sources Revenue
Manitoba.....	12,700	\$ 31,700	27,700	\$ 84,700	15,900	\$ 74,500
Saskatchewan.....			10,000	27,800	18,500	35,300
Alberta.....	13,700	31,300	18,000	47,800	17,900	79,000

In 1921, big game, comprising moose, deer, caribou, mountain sheep and goats, was taken to the amount of 1,159; 927, and 2,361 head for the provinces of Manitoba, Saskatchewan and Alberta respectively.

Fur Farms.

In 1921 the Prairie Provinces contained twenty-five fur farms, which increased to fifty-three during 1922, distributed as follows,—Manitoba 20, Saskatchewan 9, and Alberta 24. The total value of farms in 1921 was \$189,000 and the value of the animals \$610,785. The fifty-three fur farms include forty-six fox, three muskrat, two beaver, one skunk, and one karakul sheep farm.

Farming Wild Game.

An experiment is now being tried that suggests a way to the development of an expansive and profitable industry, namely, the wild bird farm. Such a farm is located in central Alberta and between fifty and sixty different breeds of wild game birds are bred there, including wild ducks, turkeys, pheasants, grouse, geese, prairie chicken, quail, guinea hens and peafowl.

GAME LAWS 1922

OPEN SEASON ☐

CLOSED SEASON

MANITOBA

	JANUARY	FEBRUARY	MARCH	APRIL	MAY	JUNE	JULY	AUGUST	SEPTEMBER	OCTOBER	NOVEMBER	DECEMBER
Bag Limit—Deer etc. one male only, <i>Prarmigan</i> , 15 a day, total 50 for the season. Geese 10 a day, Ducks 20 a day before Oct. 1st, 40 a day thereafter, 200 for the season. <i>Prairie Chicken</i> , <i>Partridge</i> and other grouse, 25 in all.												
Moose, Deer, Cabri or Antelope, Reindeer or Caribou.												130
Otter or Beaver,(south of 53rd parallel.) Beaver(north of 53rd parallel.)												
Otter(north of 53rd parallel.)
